Abstract—The authors examined the effects of a 6-week training program on the performance of 10 male triathletes. The subjects were divided into two groups: control and experimental. The control group continued their normal training regimen, while the experimental group followed a structured training program designed to improve their endurance and speed. Performance was measured at the beginning and end of the training period using various metrics such as time to complete a set distance, heart rate, and perceived exertion. The results showed that the experimental group experienced significant improvements in all measured parameters compared to the control group.
