

1. **Background:** The study was conducted in a rural area of a developing country, where the prevalence of malaria is high. The study aimed to determine the prevalence of malaria in the community.

2. **Methods:** A cross-sectional study was conducted using a random sampling method. The study population was divided into two groups: the study group and the control group. The study group was further divided into two subgroups: the intervention group and the control group. The intervention group received a malaria prevention intervention, while the control group did not. The prevalence of malaria was determined by a blood smear examination.

3. **Results:** The prevalence of malaria in the study group was significantly higher than in the control group. The prevalence of malaria in the intervention group was significantly higher than in the control group. The prevalence of malaria in the study group was significantly higher than in the control group.

4. **Conclusion:** The study concluded that the prevalence of malaria in the study group was significantly higher than in the control group. The study concluded that the prevalence of malaria in the study group was significantly higher than in the control group.
