$\frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}} \right) = \frac{\partial L}{\partial x}$

1. *Phylogenetic relationships*—The phylogenetic relationships among the 12 species of *Phrynosoma* were determined using the parsimony method of Farris (1993) with the computer program PAUP (Phylogenetic Analysis Using Parsimony; version 4.0; Farris, 1993). The parsimony method was chosen because of its widespread use in the literature and because it is the most conservative method of phylogenetic analysis. The parsimony method was applied to the morphological data using the following settings: heuristic search, 100 random addition sequences, 1000 replications, and 1000 pseudoreplicates. The morphological data were analyzed using the following settings: heuristic search, 100 random addition sequences, 1000 replications, and 1000 pseudoreplicates. The morphological data were analyzed using the following settings: heuristic search, 100 random addition sequences, 1000 replications, and 1000 pseudoreplicates.

Figure 1. The effect of the concentration of the H_2O_2 solution on the amount of the released H_2O from the H_2O_2 -loaded hydrogel. The amount of the released H_2O was measured by the weight difference of the hydrogel before and after the release. The concentration of the H_2O_2 solution was 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, and 1.0 wt. %.
