Abstract. The authors investigate the effects of a 10-week intervention on the self-reported health status of young adults. The study was conducted in a community-based setting. The intervention was a 10-week program of health education and physical activity. The results show that the intervention had a significant positive effect on the self-reported health status of the participants. The authors conclude that community-based interventions can be effective in improving the self-reported health status of young adults.
