can be used to estimate the effect of the intervention on the outcome. The effect of the intervention is estimated by comparing the mean of the outcome variable in the intervention group with the mean of the outcome variable in the control group. The effect of the intervention is estimated by comparing the mean of the outcome variable in the intervention group with the mean of the outcome variable in the control group.

que la alianza se centró en lograr el liderazgo de consorcio, y así la alianza se convirtió propiamente en un tipo de "grupo" primario interorganizacional de alta cohesión y de consenso, la naturaleza del mismo dependió de cada caso en particular.

estimation, it is not clear that the model is well specified. The model is estimated using the maximum likelihood method, which is not appropriate for this type of data. The model is estimated using the maximum likelihood method, which is not appropriate for this type of data.
