PLANNING & DESIGN

Construction

The main service areas

We provide services in general, but also specialized services for regional projects, the most important part of our professional activities:

- We help in planning all stages of project implementation. We consider the number of the required funds for the building, the problems of financing and the feasibility of the project.
- We have obtained many positive reviews from our clients on our work in construction and design of residential buildings, in building modern shopping centers and residential complexes for the middle class.
- We are engaged in construction and implementation of industrial facilities, for specific projects, the production capacity of which can be up to 1000 units per year.
- Technical documentation for construction and implementation of residential houses (SHT), we carry out according to drawings of the designer and engineer. We can also draw up plans after your comments upon discussions with you by telephone or e-mail.
- We will help you to find reliable and experienced providers of equipment in various industries (e.g. for 1000 new residential buildings) and other resources.

How to calculate the area of a rectangle or square

The dimensions of the room must measure in square feet before you can determine square footage or square inches needed for insulation that will effectively heat the house during the winter months.

For example if you have a room that measures 10 feet wide by 12 feet long you would multiply 10 times 12 which equals 120 square feet.

Top: Width
Bottom: Length
