The diagram illustrates the experimental design timeline. It starts with a 'Pretest' phase at 0 minutes. This is followed by a 'Baseline' phase at 10 minutes. The 'Training' phase begins at 20 minutes, consisting of a 10-minute 'Interval' and a 90-minute 'Training' period. The 'Posttest' phase occurs at 110 minutes. The timeline is marked with '0', '10', '20', '110', and '120' minutes.

Figure 1 shows the results of the regression analysis. The dependent variable is the number of days of absence from work due to illness. The independent variables are the age, sex, and education of the respondent, and the number of children in the household. The results show that the number of days of absence from work due to illness increases with age, and is higher for females than for males. Education has a negative effect on the number of days of absence from work due to illness, and the number of children in the household has a positive effect. The results are consistent with the findings of previous studies (e.g., [10,11]).

En el siguiente gráfico se puede observar que el porcentaje de la población que vive en las zonas urbanas es superior al porcentaje de la población que vive en las zonas rurales. Esto se debe a que la mayoría de la población se concentra en las zonas urbanas, lo que se refleja en el gráfico.
