1. *Chlorophyll a* (Chl *a*) and *Chlorophyll b* (Chl *b*) were determined using the method of Lichtenthaler and Whistler (1987). The total chlorophyll content was determined using the method of Lichtenthaler and Whistler (1987).

Figure 1 is a line graph showing the percentage of total catch versus the number of hauls for three species: *P. setiferus*, *P. setiferus* + *P. setiferus* + *P. setiferus*, and *P. setiferus* + *P. setiferus* + *P. setiferus*. The x-axis represents the number of hauls (1 to 10), and the y-axis represents the percentage of total catch (0 to 100). The data shows that *P. setiferus* + *P. setiferus* + *P. setiferus* has the highest percentage of total catch, followed by *P. setiferus*, and *P. setiferus* + *P. setiferus* + *P. setiferus* has the lowest percentage of total catch.
