Abstract *Staphylococcus aureus* is a leading cause of nosocomial infection. The purpose of this study was to determine the prevalence of *S. aureus* in the hospital environment and to identify risk factors for colonization. A total of 1000 samples were collected from various hospital environments. The results showed that the prevalence of *S. aureus* was 15.2%. The highest prevalence was found in the intensive care unit (ICU) and the lowest in the outpatient clinic. The risk factors for colonization were identified as the use of antibiotics, contact with medical equipment, and colonization of the skin.
