 This book is printed on acid-free paper.

For the second data set, we used 1 mol/L of a mixture of 100% methanol and 100% water, and the results are shown in Table 1. The results show that the mixture of 100% methanol and 100% water is a good solvent for the polymerization of styrene, and the results are similar to those of the first data set. The results also show that the mixture of 100% methanol and 100% water is a good solvent for the polymerization of styrene, and the results are similar to those of the first data set.

Table 1 presents the regression coefficients for the two models. The first model shows the results for the full sample, and the second model shows the results for the subsample of firms that are not in the top 100. The results show that the regression coefficients for the full sample are significantly different from zero at the 1% level, while the regression coefficients for the subsample of firms that are not in the top 100 are not significantly different from zero at the 1% level.
