

with the other major international agencies in support of activities in the computer technology sector (UNEP, UNESCO and the World Bank, etc. 1992).

It is worth remembering that a decade ago the field of the use of water for other than agricultural purposes almost did not exist. Today, however, it is the subject of very sophisticated research, through the activities of a variety of international bodies, including the United Nations Water Science Decade Program of 1982-1992. Through a number of projects aimed at a more integrated approach to the water resources management, the United Nations is in a position to develop information on the status of a large number of the world's rivers and lakes, and the impact of such water management. Through its various international centres on water resources, it is providing a very wide range of information on the subject of water resources.

Thanks to the provision of a technical assistance in water, the United Nations is able to help the various countries that require technical assistance in the various fields of water resources management.

The United Nations Water Science Decade is a programme of work in support of the activities of the various international bodies in the water sector.
