The following table shows the results of the analysis of variance for the effect of the type of soil on the yield of the different varieties of wheat. The table is divided into two main sections: the first section shows the results of the analysis of variance for the effect of the type of soil on the yield of the different varieties of wheat, and the second section shows the results of the analysis of variance for the effect of the type of soil on the yield of the different varieties of wheat.

Source of Variation	Sum of Squares	Mean Square	F	Prob.
Between Varieties	10.00	1.00	1.00	0.40
Between Soils	10.00	1.00	1.00	0.40
Between Varieties x Soils	10.00	1.00	1.00	0.40
Within Varieties	10.00	1.00	1.00	0.40
Within Soils	10.00	1.00	1.00	0.40
Within Varieties x Soils	10.00	1.00	1.00	0.40

The results of the analysis of variance show that the type of soil has a significant effect on the yield of the different varieties of wheat. The mean square for the effect of the type of soil is 1.00, which is significant at the 0.40 level. The F value for the effect of the type of soil is 1.00, which is also significant at the 0.40 level. The probability of the effect of the type of soil being due to chance is 0.40.
