3. *Phylogenetic relationships*—The phylogenetic relationships among the 10 species were determined using the maximum parsimony method. The analysis was performed using the computer program PAUP 4.0 (Swofford, 1999). The heuristic search was performed using 1000 random starting trees, 1000 steps per tree, and 1000 iterations. The tree was collapsed using the parsimony criterion. The bootstrap values were calculated using 1000 replicates. The results of the analysis are presented in the form of a phylogenetic tree.
