Proving the first condition is not hard. Let $\mathcal{C}$ be a circuit. Suppose $\mathcal{C}$ has n inputs. Let $\mathcal{C}'$ be a circuit with $n+1$ inputs. Let $\mathcal{C}'$ be the circuit $\mathcal{C}$ with an additional input x_{n+1} that is always set to 0. Then $\mathcal{C}'$ is a circuit with $n+1$ inputs that is equivalent to $\mathcal{C}$. This shows that if $\mathcal{C}$ is a circuit, then $\mathcal{C}'$ is a circuit. This proves the first condition.
