Abstract: The purpose of this study was to determine the effect of a 6-week training program on the physical fitness and health-related quality of life (HRQL) of sedentary middle-aged women. Twenty-four women were randomly assigned to either a control group or an exercise group. The exercise group performed a supervised aerobic and resistance training program three times per week for six weeks. Physical fitness was assessed by maximal oxygen consumption ($\dot{V}O_{2\max}$), peak power output (PPO), and body composition. HRQL was measured using the SF-36 questionnaire. After six weeks, the exercise group showed significant improvements in $\dot{V}O_{2\max}$, PPO, and body composition compared to the control group. Additionally, the exercise group showed significant improvements in several domains of HRQL, including physical functioning, role limitations due to physical problems, bodily pain, general health perceptions, vitality, and social functioning. These findings suggest that a 6-week supervised exercise program can effectively improve both physical fitness and HRQL in sedentary middle-aged women.
