are the eigenvalues of the matrix  $\mathbf{A}^T \mathbf{A}$  and  $\mathbf{A}$  is the matrix  $\mathbf{A} = \mathbf{A}^T = \mathbf{A}^T \mathbf{A}$ . A sufficient condition of local optimality is given by the following theorem. Theorem 1. Let  $\mathbf{A}$  be a positive definite matrix and  $\mathbf{A}^T \mathbf{A}$  be a positive definite matrix. Then, the point  $\mathbf{x}^*$  is a local minimum of the function  $f(\mathbf{x})$  if and only if  $\mathbf{A}^T \mathbf{A}$  is a positive definite matrix.

As a result, the model is able to capture the underlying structure of the data, and the resulting model is able to predict the target variable with high accuracy.
