Pharmaceutical Research and Development (R&D) is the process of creating new drugs. It is a complex and costly process that involves many steps, from target identification to clinical trials. The R&D process is often divided into three main phases: target identification, target validation, and drug development. Target identification involves identifying a disease or condition that is a good target for drug development. Target validation involves demonstrating that the target is a good target for drug development. Drug development involves the design, synthesis, and testing of new drugs. The R&D process is often a long and difficult process, but it is essential for the development of new drugs that can improve the lives of patients.
